

“Device for straightening and closing the rear flap for a self-dimensioning machine for closing parallelepiped boxes”

* * *

ABSTRACT

5 Herein described is a device for closing the rear flap in a self-dimensioning machine for closing the upper flaps of parallelepiped boxes of the type comprising a base with support surface for the boxes, a couple of drive belts that can be motorised placed at the two sides of said support surface and that can be brought close to each other to make a drive
10 engagement with the sides of the boxes and a head above said support surface, that carries devices for closing the front, rear and side flaps of the boxes and can be commanded to descend from a rest position to engage the above-mentioned devices with the upper flaps of the boxes and to close them. The device for closing the rear flap comprises a rod for straightening
15 the rear flap, that is pivoted on said head and can be commanded to rotate from a substantially horizontal rest position to a vertical working position and to translate in the same direction as the boxes advancement to carry out the straightening of the rear flap, a touching group vertically mobile that can be commanded to descend towards said support surface up to a position
20 depending on the height of the box and a lever pivoted on said touching group downstream from said straightening rod and flexibly kept in an angular position suitable for meeting with its inclined surface, during the descent of the touching group, the straightened rear flap and thus to cause the movement of the flap in closing position.
